

Galileo® Mano 20 Dumbbells

Therapy for hands, arms and upper part of the body especially for children and neurological application.

The Galileo Mano Med dumbbell systems are particularly used to reduce spasticity or used to alleviate movement restrictions and circulatory disorders and improve motor function or invigorate the muscles.

The Galileo Mano Med 20 dumbbell system enables relaxing and demanding therapy sessions as the situation requires. Muscular deficiencies of the upper extremities and the area of the shoulder and neck are quickly and effectively treated so that the freedom of movement for example after an injury to the shoulder is restored after a very short time. The switching on of the integrated wobble function enables a random changing stimulation frequency (vibrations per second).
